

AMPLIFIER SIGNAL INPUT

USING 3RD PARTY SOURCE UNIT

When using any NavAtlas amplified product, the Analog RCA input requires a 3Volt or greater pre-out from the source unit to maximize the volume output. In developing our product, we have matched our amplifier's preamp section to our Command Centers, radios, and Bluetooth controllers signal output. In doing this, our product can be played at maximum volume without clipping or distorting, in most cases.

When using our amplified product with 3rd party source unit, there is a limitation of volume due to the radios output being a lower voltage, **2.5Volt or lower**. To solve this, there must be an RCA line driver between the source unit and the amplifier. We recommend using the PAC LD-10 or equivalent product in such case.
